

Research Questions & Visualization Guide

Market Women Waste Disposal & Disease Risk Study | Survey: 2,000 Respondents | Dataset: 2,000 Records

SQL Analysis Questions

- Q1.** How many of the 2,000 market women reported illness in the last 3 months?
- Q2.** What is the most common disposal method among women with high disease risk?
- Q3.** Which education level group has the lowest hygiene knowledge score on average?
- Q4.** How many women who dump waste near water bodies also reported illness?
- Q5.** What percentage of women who received intervention had disease incidence reduced?
- Q6.** Which income group relies most on harmful disposal methods?
- Q7.** How many women with no access to clean water reported illness?
- Q8.** What is the average hygiene knowledge score before and after intervention?
- Q9.** Which age group has the highest perceived disease risk level?
- Q10.** How many women changed disposal behaviour after receiving intervention?

Power BI Visualization Questions

- V1.** What does the distribution of disposal methods look like across all respondents?
- V2.** How does disease risk level vary by proximity to water body?
- V3.** What is the before vs. after hygiene improvement among women who received intervention?
- V4.** Which disposal method group had the highest illness rate?
- V5.** What share of women benefited from the targeted intervention?

Study context: Survey data collected from 2,000 market women via questionnaire. Excel used for data cleaning. SQL used for statistical analysis. A significant link was identified between improper waste disposal and disease risk, leading to targeted interventions that improved hygiene outcomes.
